

## Proven Multi Level Data Security

- ✓ IP ADDRESS LOCKDOWN: Evident systems can be locked down to only accept connections from users on specific IP addresses
- ✓ WEBQUOTA: Limits access to computer resources based on user accounts, and provides dictionary attack protection that recognizes and prevents unauthorized logins
- ✓ ROBOT REJECTION: Many Search engines use “robots” to find web pages for public searching; with the Robot Rejection Utility, your critical information cannot be read or added to their databases
- ✓ DATA TRANSFER ENCRYPTION: The industry-standard security “handshake” provided by SSL encrypts all data moving between the “Evident” server and the user’s computer
- ✓ PASSWORD STRENGTH: Enables firms to define password requirements that meet security guidelines established by the U.S. National Institute of Standards and Technology
- ✓ CASE FILTERING: Controls the databases, which are available to each user – they see the cases they’re supposed to see, and they don’t even know other cases exist.
- ✓ FOLDERS SECURITY: Ensures the integrity of folders by controlling who can see those folders and who can add or remove documents to/from a folder. This provides another method for controlling the level of access granted to different users
